the MARKET FOR FOOD IN PUBLIC SCHOOLS

U.S. DEPARTMENT OF AGRICULTURE
Agricultural Marketing Service
Marketing Research Division

PREFACE

Food served in schools is an important segment of the away-from-home eating market. Further expansion is likely to take place as new schools are constructed with modern cooking and cafeteria facilities and as school enrollments continue to rise. This study on food in schools was undertaken as a part of a broad program of research to expand markets for farm products.

The research attempts to chart the current and potential size of the market for food in public elementary and high schools for food manufacturers and distributors as well as Department, State, and local officials responsible for school feeding programs. Of the 106,000 public schools below the college level, approximately 60,000 were offering a lunch service during the period July 1957 through June 1958. About 54,000 of the public schools with a lunch service participated in the National School Lunch Program.

During the survey period, there were approximately 16,000 nonprofit private schools below the college level in the Nation. Over 2,400 of these participated in the National School Lunch Program under the direction of the Food Distribution Division, Agricultural Marketing Service. These would be in addition to the 60,000 public schools having food services, but private schools were not included in the study because of sampling difficulties involved.

The sample consisted of 500 public schools having a food service. The schools were selected on an area probability basis and the sample data projected to universe totals. In total and for National School Lunch Program schools, the sampling error of estimate was relatively low for both quantity and value for all but three food groups--frozen fruits and vegetables, juices, and beverages.

Schools having a food service but not participating in the National School Lunch Program had a much higher sampling error than those participating because of the limited number of observations in the nonprogram schools. Likewise, estimates for items of smaller magnitude are likely to have a higher relative sampling variation. Similarly, estimates with respect to particular types of food commodities may be subject to somewhat greater sampling variation than the major food groups.

Information on the number of schools with food service was available from an earlier study, "Participation of Schools and Pupils in School Lunch Programs in Elementary and Secondary Schools of the United States". The Bureau of the Census collected and tabulated the data in the present report. In this connection, special acknowledgment is made to Allen D. Manvel, Joseph F. Arbena, and Rebecca E. Dove, Governments Division, Bureau of the Census. Officials of the Food Distribution Division, especially Samuel C. Vanneman and Leonard Garroway, Agricultural Marketing Service, offered helpful counsel and advice in the planning and development of this research.

The study was conducted under the general direction of Robert M. Walsh, Chief of the Market Development Branch, Marketing Research Division, Agricultural Marketing Service.

THE MARKET FOR FOOD IN PUBLIC SCHOOLS

By Kenneth E. Anderson and William S. Hoofnagle,
Market Development Branch, Agricultural Marketing Service

SUMMARY

During the period July 1957 through June 1958, the total wholesale value of food, both purchased and donated, delivered to approximately 60,000 public schools having a feeding service, amounted to $597 million or $28 per capita based on an average daily attendance of slightly over 21 million pupils.

Results of the study indicated that the school market is primarily a local one; and that the role of Government is relatively small in supplying most commodities to the school outlet. About $505 million or 85 percent of the total value of food used in schools was acquired through commercial channels in nearby markets.

The most important single food item valuewise in schools was fluid whole milk, accounting for almost one-third of the school food dollar. Based on average daily attendance in the approximately 60,000 schools with a food service, enough milk was distributed during the year to provide each child with 154 half-pints. The half-pint is the usual serving unit. (See chart.)

One of the most popular items in the school lunch menu was ground beef, accounting for 77 percent of all beef deliveries to this outlet. Another important meat item was frankfurters comprising 2 cents of each school food dollar.

Fruits and vegetables in all forms accounted for slightly more than 15 cents of each school food dollar. Canned fruits and vegetables are particularly important in school feeding programs, with over three-fourths of the purchases of these items being made in commercial channels from local merchants.

About 18 percent of the public schools with feeding service used vending machines to dispense certain beverages and foods such as milk, soft drinks, crackers, and candy during the survey period.

In all likelihood, the school outlet will continue to grow in importance as a market for farm products, as the pupil population increases and new schools are built with modern cafeteria facilities.

BACKGROUND

Substantial quantities of food are utilized in school lunch programs; the major portion of this food is purchased locally. The school outlet is considered a desirable means of utilizing commodities acquired by the Government through various price stabilization and surplus removal programs. The school lunch program provides a medium whereby new or improved foods may be introduced on a nationwide basis. Children participating in lunch programs are thus exposed to new foods or familiar foods in new form, learning at the same time to select well-balanced meals and the importance of good eating habits.

School feeding is widely recognized by educators and school administrators as an important adjunct of the school program. The National School Lunch Program is jointly administered by the U. S. Department of Agriculture and State educational agencies. It provides food assistance to schools operating a nonprofit food service for children. Federal assistance for school lunch programs first became available during the early 1930's. Federal legislation enacted in 1935 enables the Department of Agriculture to provide schools serving lunches with certain agricultural commodities on a nonprofit basis.

With the passage of the National School Lunch Act in 1946, school feeding was placed on a permanent basis. Schools participating in the program receive cash and commodity donations to help them serve well-balanced, low-cost noonday lunches. To be eligible to receive this assistance, schools must agree to operate the lunch on a nonprofit basis, serve meals that meet specified nutritional standards, and serve lunches free or at a reduced price to those children unable to pay in full.

Under the program, schools serve a Type A lunch requiring the serving of foods which meet certain nutritive requirements. The Type A lunch translates the nutritive requirements of the National Research Council into a meal pattern meeting one-third to one-half of a child's daily dietary needs. Because of the emphasis the National School Lunch Program places on well-balanced meals, there is a heavy concentration in purchases of meat, dairy, poultry, fruit, and vegetable items.

The basic purpose of the study was to determine the quantities and wholesale value of the different foods, both purchased and donated, delivered to schools, and the buying practices and market channels used in acquiring food. The study was further designed to develop benchmarks for food manufacturers and distributors by which to gage the size of the market for the different foods utilized in school lunch operations, and to assist Department, State, and local officials in evaluating and improving feeding operations in schools in terms of the kinds and quantities of foods acquired. The National School Lunch Program provides a basic outlet for perishable commodities acquired under surplus removal operations. The size of the surplus removal program is limited by the capacity of outlets to utilize such foods as are acquired. Therefore, detailed information was obtained on the food utilization capacity of schools in the United States on both a total and per capita basis.

Because of the urgent need for current data on foods utilized in schools, the statistical data in this report are being issued with a minimum of descriptive information and a short summary, highlighting some of the important findings. By this procedure, food manufacturers, distributors, and handlers as well as school administrators and Federal and State officials concerned may have use of the information at the same time analytical studies are being carried on by research groups within the Department.

DEFINITION OF TERMS

Certain terms widely used in the study are defined for the sake of clarity. They include: (1) Size of school (enrollment), small, under 300 and large, 300 and over; (2) average family income level of area served by school (dollars), low, under $4,000 and high, $4,000 and over; and (3) urbanization (population density), rural, under 2,500 and urban, 2,500 or more.

Per capita quantity and value of food was calculated on the basis of the average daily attendance of children in public elementary and secondary schools having a food service.

PROCEDURE

Deliveries of purchased and donated foods to sample schools were recorded over a 12-month period by 2-month intervals, beginning with July 1957 and ending with June 1958. The sample was subdivided into approximately six equal sub-groups of schools, with invoices of deliveries taken in a rotating pattern to provide coverage in all months of the year so as to overcome seasonal factors. The value of deliveries was determined by using actual prices paid for foods purchased by the sample schools and the wholesale market prices for donated foods. The information on the delivery invoices from the sample schools was tabulated for a 12-month period and projected to United States totals for deliveries and value on an annual basis. In addition, data are shown for schools participating in the National School Lunch Program, all other schools having a feeding service, and total schools.

In addition to quantity and value data for purchased and donated foods, certain descriptive information pertaining to the school and the socio-economic characteristics of the community was obtained. This information included grades taught, size in terms of pupils enrolled, income level of the community served by the school, location of school with respect to urban or rural community, kinds of food service, whether the school participated in the National School Lunch Program, and availability in terms of cubic feet of dry, cold, and freezer storage space within the school. As a part of the survey, information was obtained on the extent to which vending machines were used to sell milk, soft drinks, candies, crackers, etc., in public schools.

The basic data in the market survey for food in schools relates only to deliveries. For the most part, however, deliveries over the period selected, July 1957 through June 1958, would correspond closely to disappearance in this outlet. Most schools attempt to utilize all foods on hand before the close of the school year and order very closely as this period approaches. For the perishable items such as meat, milk, fresh fruit, and vegetables, etc., deliveries do correspond to disappearance, including actual use, loss, and spoilage.

The list of foods used in this survey is comparable with that employed in a study of industrial inplant feeding, the idea being that at some future time all data relating to the away-from-home eating market might be combined to yield a composite picture of this segment of the market for food.[1]

SURVEY FINDINGS

The total value of foods, both purchased and donated, delivered to approximately 60,000 public elementary and secondary schools having a feeding service (either plate or a la carte) between July 1957 and June 1958 amounted to $597 million or $28 per capita based on average daily attendance figures of slightly over 21 million pupils. About $505 million, or 85 percent of the total value of food moved into this outlet, was acquired from local sources. The remaining portion, or approximately 15 percent of the total dollar value of commodities, comprised those donated directly by the Government from purchases made especially for school lunches or from stocks acquired under various price stabilization and surplus removal programs.[2]

Schools participating in the National School Lunch Program--about 54,000--received 94 percent of the total value of foods delivered to public schools having a feeding service during the survey period. Nearly all of the foods donated went to schools operating under the National School Lunch Program.

Foods acquired by schools were on an actual cost basis. For the most part, however, school purchases were made at the wholesale level. All donated foods delivered to schools were assigned a wholesale value.

In addition to the approximately 60,000 public schools offering a complete plate lunch or a la carte service, there were over 19,000 public schools offering milk only. During the survey period, over 26,000 public schools did not offer any type of food service.

Milk and Milk Products

The value of milk and milk products, excluding butter, delivered to public schools amounted to $231 million or almost $11 per pupil. Fluid whole milk accounted for the lion's share of the total value, $192 million or 83 percent, followed by ice cream, accounting for $17 million or 7 percent. The remaining 10 percent of total value was in such items as natural and processed cheese, nonfat dry milk solids, and other processed dairy products.

Dairy products, excluding butter, accounted for almost 39 cents of each dollar's worth of food delivered to public schools, including both purchased and donated items. Fluid whole milk alone accounted for 32 cents.

Approximately 3 1/2 billion half-pints (the usual serving unit) of fluid whole milk were utilized in the school market, making available 154 half-pints per pupil annually.

The value of dairy products delivered to public schools serving lunches was highest in schools situated in urban areas, those offering only the elementary grades, those having more than 300 pupils, in areas where family incomes were less than $4,000, and in schools participating in the National School Lunch Program.

Meat, Poultry, and Fish

Meat, poultry, and fish moved into the school outlet between July 1957 and June 1958 had a monetary value of almost $108 million, next in importance moneywise to that of dairy products. On a per capita basis, $5 worth of meat, poultry, and fish were available for consumption in those public schools having a feeding service. Red meats accounted for the major portion of the total money value, $83 million, with the remainder almost equally divided between fish and poultry. In the red meat category, hamburger was the most important food item on both a monetary and a poundage basis, comprising almost 43 percent of the total monetary value.

Meat, poultry, and fish made up 18 cents of the school food dollar, including both purchased and donated foods. Meat alone accounted for 14 cents, fish and poultry each about 2 cents. Hamburger ranked next to fluid whole milk in the proportion of the school food dollar allocated to individual items in the diet. Butter ranked the same as hamburger.

Somewhat over 182 million pounds of red meat were delivered to public schools, of which roughly 60 percent was

[2] Approximately 2,400 of the 16,000 nonprofit private schools below the college level participated in the National School Lunch Program under the direction of the Food Distribution Division, Agricultural Marketing Service, during the period studied. However, no data were obtained from these schools.

beef. Poundagewise, lunch meats, including frankfurters, were the next most important item, followed by pork. Of the red meats, the quantities of veal and lamb delivered to schools were relatively small.

The per capita quantity of all meat used in schools participating in the National School Lunch Program was 8.6 pounds and for all other schools 7.1 pounds. Per capita value of meat was $3.93 in participating schools and $3.24 in nonparticipating schools--value per pound was approximately the same in both categories.

Almost 30 million pounds of poultry were delivered to schools during the survey period, of which well over 18 million pounds were fresh, frozen, and canned chicken; 11 million pounds were turkey meats. Other poultry products accounted for a negligible quantity in this food group.

There were 28 million pounds of fish delivered to the school lunch outlet in the 12-month period covered by the study. The quantity of fresh and frozen fish utilized in public schools was only slightly larger than that of canned fish items. Tuna was by far the most important canned fish item, accounting for almost 8 million pounds. It was followed by salmon which represented slightly over 4 million pounds of the total canned fish items.

Fresh, Frozen, Canned, and Dried Fruits and Vegetables Including Juices

Fruits and vegetables in all forms, including juices, delivered to schools were valued at $91 million, or $4.26 per child during the survey year. Canned fruits and vegetables accounted for 70 percent of the total value, with canned vegetables being the more important from a monetary standpoint. Ranking next in order were fresh fruits and vegetables, accounting for $21 million, or about 23 percent of the total monetary value of these combined food categories.

One of the most popular items in the school lunch menu, canned peaches, accounted for about 52 million pounds or 29 percent of the total canned fruits utilized in schools. About 5 percent of the 1957-58 total pack, including freestone and clingstone peaches, moved into this outlet. Of the total canned fruits delivered to schools, approximately 136 million pounds or 76 percent was acquired from local merchants.

The most popular vegetable item in the school market included green beans, green peas, tomatoes, and corn. The proportion of the 1957-58 total pack of these 4 vegetables utilized in schools varied from 4 to 8 percent. Almost 241 million pounds or 86 percent of the canned vegetables were acquired in commercial channels at the local level.

Fruits and vegetables in all forms made up 15.3 cents of the public school food dollar. Of this amount, 10.7 cents were for canned items, 3.5 were for fresh items, and the balance was for juices and dried items.

Bakery Products

Bakery products going into the public school market had a value of $46 million annually, about $2.15 per pupil. Baked bread was the most important item, making up one-half of the total dollar value of this food category.

Of the school food dollar, bakery products accounted for nearly 8 cents, bread alone making up one-half of this amount followed by unsweetened rolls and cookies.

Bread accounted for 140 of the 219 million pounds of bakery products delivered to schools, making available for consumption 6.5 pounds per pupil.

Fats and Oils

Fats and oils including butter delivered to the school were valued at more than $43 million or slightly over $2 per child. Of this amount, butter accounted for $36 million or $1.67 per child. Butter, for the most part donated directly to schools, took up 83 percent of the total value of all fats and oils moved into this outlet, followed by salad dressing taking 8 percent, with the remainder going to such items as solid shortenings, salad and cooking oils, and margarine.

Fats and oils including butter comprised slightly over 7 cents of the school food dollar, of which butter made up 6 cents.

Almost 63 million pounds of butter--of which 62 million pounds were donated--went to public schools during the survey period, July 1957-June 1958, making available for consumption almost 3 pounds per child. Salad dressings and shortenings were other items in this food category delivered in substantial quantities.

Salad dressings, salad and cooking oils, and margarine were purchased entirely from local merchants.

Beverages and Miscellaneous Foods

Beverages and miscellaneous foods such as catsup, pickles, relishes, seasonings, puddings, etc., taken individually did not comprise any sizable proportion of the total monetary value of foods delivered to schools. Collectively, however, they ac-

counted for $31 million, or a little over 5 percent of the total value of all foods.

Flour and Other Cereal Products

Flour and other cereal products delivered to the school outlet were valued at $15 million or 70 cents per pupil. From a value standpoint, flour was the outstanding item of this food group.

Flour and other cereal products account for 2.5 cents of the school food dollar, comprising both purchased and donated items. Of this total, flour alone accounted for almost 1 cent.

There were 74 million pounds of white flour delivered to public schools, the major portion of which was donated directly by the Government from supplies acquired under price stabilization programs.

Potatoes, Sweetpotatoes

Potatoes and sweetpotatoes, valued at just under $14 million, were received in public schools between July 1957 and June 1958, providing about 64 cents worth of these food products per child. Fresh, frozen, and canned white potatoes comprised 65 percent of the monetary value, followed by potato chips and sticks, accounting for 23 percent. Potatoes and sweetpotatoes comprised 2.3 cents of each food dollar in public schools, of which white potatoes in all forms accounted for almost the entire amount.

Eggs

Eggs, both fresh and processed, delivered to schools having a feeding service, were valued at $10 million. The value of processed eggs was nearly equal to that for fresh ones.

Of the school food dollar, eggs made up 1.7 cents. For the processed egg items, the dried product accounted for the major portion of the monetary value.

Sugar, Sweets

About $8 million worth of sugar and other sweets including sirups, molasses, honey, jams, jellies, preserves, candies, etc., were received in public schools, or about 40 cents worth per pupil annually. Refined sugar was by far the most important single item in this particular food group, accounting for roughly three-fifths of the monetary value.

Candy is the only sugar and sweets item that was available for consumption in smaller quantities per pupil in National School Lunch Program Schools than in nonprogram schools. In terms of value, candy ranked second as a sugar and sweets item in public schools.

Sugar and sweets accounted for relatively little of the school food dollar, only 1.4 cents. Of this amount sugar and candy made up the bulk of the monetary outlay.

Seasonality of Food Deliveries Based on Value

From a marketing standpoint, it was desirable to determine the seasonal pattern of deliveries of foods by months based on monetary value. To accomplish this, an index of deliveries based on value over the 12-month survey period was established. As was logical, value of deliveries was highest at the beginning of the school session; that is, in September and October when 14 percent and 13 percent, respectively, of the total value of commodities moved into this outlet. From November through May, value of commodities delivered ranged from a high of 12 percent in January to a low of 8 percent in May. During June, July, and August deliveries to schools were almost negligible.

Vending Machines

Of the approximately 60,000 public schools with a feeding service, about 18 percent used some kind of food dispensing machine between July 1957 and June 1958. In terms of number, the most popular were those vending soft drinks, followed by those providing milk, candy, crackers, and other similar food items. As for school and community characteristics, vending machines in general were most prevalent in schools having an enrollment of 300 or more pupils, in schools serving an area where family incomes averaged under $4,000, and a community population density of under 2,500 people.

Food Storage Facilities

A substantial amount of cold, freezer, and dry storage space for food exists in the Nation's schools. Cold storage space available in schools having a feeding service totaled nearly 7 million cubic feet; freezer storage almost 17 million cubic feet; and dry storage about 65 million cubic feet. Schools having storage facilities averaged in the case of cold storage 150 cubic feet, 451 cubic feet of freezer space, and 1,410 cubic feet of dry storage.

In some instances, food storage space was available outside the individual school but still in the school system. Off-premise

school storage space was used by less than 10 percent of the Nation's schools. However, where such was utilized, average amount of all kinds of space available was greater than that existing for schools using only in-school storage.

Source of Supply

Understanding usual sources of the school food supply is basic in appraising this market outlet. As a part of the survey, school food buyers were asked where they usually bought each of the following food classes: (1) Beef, pork, and veal, (2) poultry, (3) fish, (4) eggs, (5) milk products, (6) vegetables, (7) fruit, (8) bakery products, (9) cereals, (10) fats and oils, and (11) sugars, sirups, and sugar products. Nearly all purchases of these foods were made from wholesalers or processors. At least 95 percent of total purchases of the major food classes were made at the wholesale level.

There was no apparent difference in dependence on source of supply by size of school. Small schools, that is, those with a pupil enrollment of under 300, utilized to the same extent as larger ones the wholesale channels in acquiring their local food supplies.

Food Buying Practices

Information was sought from school personnel as to the manner in which food was usually acquired. That is, to what extent was food bought through a route salesman, by personal selection, by telephone, or by competitive bids. For most foods, the route salesman played an important role in supplying school needs. Sizeable quantities were also bought by telephone calls, especially the highly standardized products. Personal selection was used to some extent for certain items, namely fresh fruits and vegetables.

Competitive bidding, obtaining prices for specified food items from two or more suppliers, was more popular in larger schools than in smaller ones. For example, almost one-half of the monetary expenditures for milk products in the larger-sized schools was made through competitive bids compared with less than one-fifth in small-sized schools. Frozen and canned fruits and vegetables, and bakery and milk products, appeared to lend themselves to competitive bids in schools, especially in the larger ones.

Prices Paid for Purchased Foods

Price data were obtained for major food items within each classification, to provide an indication of the relationship between prices paid and grades taught, and other selected school and community characteristics.

Collectively, prices paid for all foods were slightly less in schools where the elementary grades were taught than in those of secondary level. The lower prices in elementary schools may be a result of greater volume moving through this particular segment of the school market. Schools providing a complete plate lunch paid a lower price per pound for all foods than those offering a la carte service. Those schools participating in the National School Lunch Program paid about 2 cents per pound less for all foods purchased than those having a food service but not participating in the program.

THE MARKET POTENTIAL

Further expansion is likely to occur in the school market as enrollments continue to rise and as new schools are constructed with modern cooking and cafeteria facilities. During the 1958-59 school year, enrollments in public schools with and without a lunch service totaled 34.7 million pupils. The Department of Health, Education and Welfare estimates that public school enrollments in the United States will reach 41.5 million pupils by 1965. By 1970 such enrollments are expected to climb to 44.5 million pupils, approximately 25 percent more than current enrollments.

Increased pupil participation in schools having a lunch program also will influence the future market for food in schools. From this study, it was found that in the schools under the National School Lunch Program the daily average number of lunches served was equal to about a half of the total average daily attendance. Part of the remaining 48 percent probably constitutes a potential demand for school lunches and, thereby, for farm products.

Still another possibility for increasing the consumption of food in schools lies in those schools without a food service. According to a 1957 study, there were over 26,000 public schools without any type of food service. An additional 19,352 schools served milk only.[3] It would seem reasonable to expect that some of these schools will have a lunch service in the years ahead and provide an additional means of increasing the use of food in this segment of the away-from-home eating market.

[3] Anderson, Kenneth E. Participation of Schools and Pupils in School Lunch Programs in Elementary and Secondary Schools of the United States. Mktg. Res. Rpt. No. 262, Agr. Mktg. Serv., U. S. Dept. Agr., Aug. 1958.
Anderson, Kenneth E. Milk Consumption in the Nation's Schools. Mktg. Res. Rpt. No. 284, Agr. Mktg. Serv., U. S. Dept. Agr., Nov. 1958.

NOTES ON USE OF TABLES

The data shown in all tables cover a 12-month period, July 1957 through June 1958. From a sample of public elementary and secondary schools, selected on a national probability basis, quantity and value data shown in tables were projected to a U. S. total. The data are presented by schools participating in the National School Lunch Program, those having a food service but not participating in the Program, and the two categories of schools combined.

Table 1 presents the total and per capita quantity and value of food groups and individual food items delivered to public schools having a food service.

Table 2 presents the total and per capita quantity and value of the delivered foods that were purchased by the schools or school systems at the local level.

Table 3 presents the total and per capita quantity and value of foods delivered to schools that were donated directly by the Federal Government from purchases made at the National level, especially for the National School Lunch Program or from stocks acquired through various price stabilization or surplus removal programs.

Table 4 shows an index of the value of food delivered to schools by months. This provides an indication of the seasonal element found in the movement of food to this market.

Table 5 presents the total quantity of delivered foods by school and community characteristics.

Tables 6 and 7 provide a breakdown of the deliveries by quantities purchased and donated, respectively. Tables 8, 9 and 10 place the quantity data found in the three previous tables (5-7) on a per capita basis. This same breakdown of data is followed in the case of value of commodities delivered, tables 11-16. This kind of information showing quantity and value of deliveries in relation to school and community characteristics is useful in developing a market profile of the school lunch outlet.

Table 17 shows the average prices paid for food purchased by public schools by selected school and community characteristics. Most all school food purchases are made at the wholesale level.

Table 18 provides a picture of the value of different foods used per meal by selected school and community characteristics. This yields an indication of the relative value of food making up a typical meal in schools in different sized schools, communities, etc.

Table 19 presents the number of schools with lunch programs and the average daily attendance of children in this category of public schools. These data indicate the potential market for food in this outlet.

Table 20 gives the number of plate lunches served to both pupils and teachers in schools by selected characteristics. This information measures the actual size of the current market for food in those schools offering a plate lunch.

Table 21 presents the number of schools having a feeding service that utilize vending machines to sell food and beverages. The use of vending machines is shown in relation to school and community characteristics. Table 22 shows the number of schools with specified types of vending machines, that is, those vending milk, soft drinks, candy, crackers, etc.

Table 23 gives the number of schools with cold, freezer, and dry storage space and the volume of each kind of space available in schools. This particular information indicated the capacity of schools to receive and handle both perishable and nonperishable items. Table 24 indicates the number of schools having cold, freezer, and dry storage space outside the school but in the school system and volume of each available.

Table 25 presents information on the proportion of major food groups obtained through specified sources. These data are given by size of school, based on pupil enrollment.

Table 26 provides an insight into the purchasing practices of school food buyers in obtaining their supplies. This information is given for each major food group in relation to size of school.

Table 27 presents the sampling error of estimates of value of food in public schools with lunch programs. This error of estimate indicates the numerical range of the true value figures for the particular food group in question. For the most part, data for the major food groups (for example "Milk and Milk Products") and the major classes in each group (for example "Fresh fluid milk") shown in tables 1 through 4 have a higher degree of statistical reliability than those items not so indicated. Likewise, data for schools participating in the National School Lunch Program have a higher reliability than those for schools having a food service but not participating in the Program because of the considerably greater number of schools under the lunch program.

TABLE 1.--Quantity and value of all foods in public schools with lunch programs, total and per pupil, July 1957-June 1958[1]

Foods	Schools under National School Lunch Program					Other schools					All schools				
	Quantity of food		Value of food			Quantity of food		Value of food			Quantity of food		Value of food		
	Total	Per pupil	Total	Per pupil	Percent of grand total	Total	Per pupil	Total	Per pupil	Percent of grand total	Total	Per pupil	Total	Per pupil	Percent of grand total
	Mil. lb.	Lb.	Mil. dol.	Dol.	Pct.	Mil. lb.	Lb.	Mil. dol.	Dol.	Pct.	Mil. lb.	Lb.	Mil. dol.	Dol.	Pct.

[1] The list of foods used in the survey is comparable to that employed on other food consumption studies carried out by the Department of Agriculture. This procedure permits the comparison of consumption data among surveys, making the information more useful on a wide, comprehensive basis.
The data are subject to sampling variance. Because of rounding, detail may not add to totals. Percentages are based on data rounded to the nearest dollar.
[2] Nonfat items are not included in quantity data on total milk and milk products as the factor is zero for converting actual weight of nonfat dry milk solids to a whole milk equivalent fat solids basis.
Does not include some 19,000 schools serving milk only. It is estimated that an additional one-third billion half-pints of whole milk were consumed in schools serving milk only.
[3] 50,000 or less.

TABLE 2.--Quantity and value of purchased foods in public schools with lunch programs, total and per pupil, July 1957-June 1958[1]

Foods	Schools under National School Lunch Program					Other schools					All schools

[1] The list of foods used in the survey is comparable to that employed on other food consumption studies carried out by the Department of Agriculture. This procedure permits the comparison of consumption data among surveys, making the information more useful on a wide, comprehensive basis.

The data are subject to sampling variance. Because of rounding, detail may not add to totals. Percentages are based on data rounded to the nearest dollar.

The quantities and value of foods donated to schools will not necessarily be identical to those shown in Departmental releases for fiscal year 1958 because of the distribution to schools of some few commodities carried over from the previous year. Also, the possibility exists that stocks distributed to States during fiscal year 1958 were not in some cases distributed completely from the warehouse or other storage points to schools because of an over-supply situation at the school level.

[2] Nonfat items are not included in quantity data on total milk and milk products as the factor is zero for converting actual weight of nonfat dry milk solids to a whole milk equivalent fat solids basis. Does not include some 19,000 schools serving milk only. It is estimated that an additional one-third billion half-pints of whole milk were consumed in schools serving milk only.

[3] 50,000 or less.

TABLE 4.--Index of value of foods delivered to public schools, by months, July 1957 - June 1958[1]

Item	July	August	September	October	November	December	January	February	March	April	May	June	Average

[1] The list of foods used in the survey is comparable to that employed on other food consumption studies carried out by the Department of Agriculture. This procedure permits the comparison of consumption data among surveys, making the information more useful on a wide comprehensive basis.

The data are subject to sampling variance. Because of rounding, detail may not add to totals. Percentages are based on data rounded to the nearest dollar.

[2] Fresh fluid milk includes chocolate drink; processed milk products includes dry milk solids (non-fat).

[3] 50,000 or less.

TABLE 12.--Value of purchased foods in public schools with lunch programs, by selected characteristics, July 1956-June 1958[1]

Foods	Grades taught		Size of school		Family income level		Urbanization		Milk service		All schools
